PGMO Days, 19-20 November 2024

Support and the ℓ_0 pseudonorm

Let $n \in \mathbb{N}^*$ be a natural number and

$$\llbracket 0, n \rrbracket = \{0, 1, \dots, n\}, \quad \llbracket 1, n \rrbracket = \{1, \dots, n\}$$

For any vector $x \in \mathbb{R}^n$, we define

- ▶ its **support** by $\text{supp}(x) = \{j \in \llbracket 1, n \rrbracket \mid x_j \neq 0\}$
 $\text{supp}((0, *, 0, *, *, 0)) = \{2, 4, 5\} \subset \llbracket 1, 6 \rrbracket$
- ▶ its **ℓ_0 pseudonorm** by

$$\ell_0(x) = \overbrace{|\text{supp}(x)|}^{\text{cardinality}} = \overbrace{\sum_{i=1}^n \mathbf{1}_{\{x_i \neq 0\}}}_{\text{number of nonzero entries}}$$

$$\ell_0((0, *, 0, *, *, 0)) = |\{2, 4, 5\}| = 3 \in \llbracket 0, 6 \rrbracket$$

The l_0 pseudonorm is not a norm

The function l_0 pseudonorm : $\mathbb{R}^n \rightarrow [0, n]$
satisfies 3 out of 4 axioms of a norm

- ▶ $l_0(x) \geq 0$ ✓
- ▶ $(l_0(x) = 0 \iff x = 0)$ ✓
- ▶ $l_0(x + x') \leq l_0(x) + l_0(x')$ ✓
- ▶ **But...** instead of absolute 1-homogeneity,
it is absolute **0-homogeneity** that **holds true**

$$l_0(\lambda x) = l_0(x), \quad \forall \lambda \neq 0$$

$$\text{supp}(\lambda x) = \text{supp}(x), \quad \forall \lambda \neq 0$$

The ℓ_0 pseudonorm is used in typical sparse optimization problems

- ▶ **Spark** of a matrix A

$$\text{spark}(A) = \min \{ \ell_0(x) \mid Ax = 0, x \neq 0 \}$$

- ▶ **Compressed sensing**: recovery of a sparse signal $x \in \mathbb{R}^n$ from a measurement $b = Ax$

$$\min_{\substack{x \in \mathbb{R}^n \\ Ax=b}} \ell_0(x)$$

- ▶ **Least squares sparse regression** (best subset selection):

$$\text{for } k \in \llbracket 1, n \rrbracket \quad \min_{\substack{x \in \mathbb{R}^n \\ \ell_0(x) \leq k}} \|Ax - b\|^2$$

“explaining” the output b by at most k components of x

SNAPSHOTS OF OUR MAIN RESULTS

A menagerie of couplings (and two more)

Coupling c $c(u, v)$	c -convex functions $f^{cc'} = f$
$\langle u, v \rangle$	closed convex $f^{**'} = f$
$u(v)$, u continuous	lower semicontinuous
$\log \langle u, v \rangle_+$	$\log \circ$ sublinear
$-N \ u - v\ ^\alpha$, $0 < \alpha \leq 1$	α -Hölder continuous with constant N
$\min_{i, v_i > 0} u_i v_i$	increasing and convex-along-rays
Capra $\check{c}(u, v) = \langle \frac{u}{\ u\ }, v \rangle$	$\check{l}_0^{\check{c}\check{c}'} = \check{l}_0$
\mathcal{H}_0	convex \circ 0-homogeneous

Fenchel conjugacy (\star) versus E-Capra conjugacy (\dagger) for the ℓ_0 pseudonorm

- ▶ Fenchel conjugacy (\star)

$$\ell_0^{\star\star'} = 0$$

- ▶ E-Capra conjugacy (\dagger)

$$\ell_0^{\dagger\dagger'} = \ell_0$$

[Chancelier and De Lara, 2021]

The ℓ_0 pseudonorm coincides, on the unit sphere, with the **proper convex lower semicontinuous**

ℓ_0 -cup function $\mathcal{L}_0 = \ell_0^{\mathbb{C}^*}$

Variational formulas for the ℓ_0 pseudonorm

Proposition

[Chancelier and De Lara, 2021]

$$\ell_0(x) = \frac{1}{\|x\|_2} \min_{\substack{x^{(1)} \in \mathbb{R}^n, \dots, x^{(d)} \in \mathbb{R}^n \\ \sum_{l=1}^d \|x^{(l)}\|_{(l)}^{\top\star} \leq \|x\|_2 \\ \sum_{l=1}^d x^{(l)} = x}} \sum_{l=1}^d l \|x^{(l)}\|_{(l)}^{\top\star}, \quad \forall x \in \mathbb{R}^n$$

$$\ell_0(x) = \sup_{y \in \mathbb{R}^n} \inf_{l=1, \dots, d} \left(\frac{\langle x | y \rangle}{\|x\|_2} - [\|y\|_{2,l}^{\top} - l]_+ \right), \quad \forall x \in \mathbb{R}^n \setminus \{0\}$$

Motivation: Legendre transform and Fenchel conjugacy in convex analysis

Definition

Two **vector spaces** \mathcal{X} and \mathcal{Y} , paired by a **bilinear form** $\langle \cdot, \cdot \rangle$, (in the sense of convex analysis [Rockafellar, 1974, p. 13])) give rise to the classic **Fenchel conjugacy**

$$f \in \overline{\mathbb{R}}^{\mathcal{X}} \mapsto f^* \in \overline{\mathbb{R}}^{\mathcal{Y}}$$

given by the **Legendre transform**

$$f^*(y) = \sup_{x \in \mathcal{X}} \left(\underbrace{\langle x, y \rangle}_{\text{coupling}} + (-f(x)) \right), \quad \forall y \in \mathcal{Y}$$

Coupling function between sets

- ▶ Let be given two sets \mathcal{U} (“primal”) and \mathcal{V} (“dual”) not necessarily paired vector spaces (nodes and arcs, etc.)
- ▶ We consider a **coupling function**

$$c: \mathcal{U} \times \mathcal{V} \rightarrow \overline{\mathbb{R}}$$

We also use the notation $\mathcal{U} \overset{c}{\leftrightarrow} \mathcal{V}$ for a coupling
[Moreau, 1966-1967, 1970]

\mathcal{H}_0 -couplings

Background on homogeneous functions and mappings

Let \mathcal{X} be a vector space

We denote $\mathbb{R}_+ = [0, +\infty[$, $\mathbb{R}_{++} =]0, +\infty[$

A set $C \subset \mathcal{X}$ is a **cone** if $\mathbb{R}_{++}C \subset C$

Definition

Let $\alpha \in \mathbb{R}$ and let $C \subset \mathcal{X}$ be a nonempty cone of \mathcal{X}

We say that a **function** $f: C \rightarrow \overline{\mathbb{R}}$ or a **mapping** $f: C \rightarrow \mathcal{X}$ is

1. **(strictly positively) α -homogeneous** (on the cone C) if

$$f(\lambda x) = \lambda^\alpha f(x), \quad \forall \lambda \in \mathbb{R}_{++}, \quad \forall x \in C$$

2. **absolutely α -homogeneous** (on the cone C) if

$$f(\lambda x) = |\lambda|^\alpha f(x), \quad \forall \lambda \in \mathbb{R} \setminus \{0\}, \quad \forall x \in C$$

We use the convention $\lambda^0 = 1$, $\forall \lambda \in \mathbb{R}_{++}$

Examples of homogeneous functions

Examples

- ▶ The ℓ_0 pseudonorm is absolutely 0-homogeneous on \mathbb{R}^n
- ▶ Any norm $\|\cdot\|$ on \mathcal{X} is absolutely 1-homogeneous on \mathcal{X} , and the radial projection $R_{\|\cdot\|}$, defined by

$$R_{\|\cdot\|}: \mathcal{X} \rightarrow \mathcal{X}, \quad R_{\|\cdot\|}(x) = \begin{cases} \frac{x}{\|x\|} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

is a 0-homogeneous mapping

Definition of \mathcal{H}_0 -couplings

Definition

Let two **vector spaces** \mathcal{X} and \mathcal{Y} be paired by a **bilinear form** $\langle \cdot, \cdot \rangle$, and let $C \subset \mathcal{X}$ be a **nonempty cone** of \mathcal{X}

A **\mathcal{H}_0 -coupling**^a between C and \mathcal{Y} is a function $c: C \times \mathcal{Y} \rightarrow \mathbb{R}$ which is

1. **0-homogeneous** in the **first variable**
(on the cone C)
2. **linear continuous** in the **second variable**
(on the vector space \mathcal{Y})

^aWe thank Prof. David L. Donoho for his suggestion to call such couplings \mathcal{H}_0 , standing for homogeneous of degree 0

\mathcal{H}_0 -couplings are left-sided 0-homogeneous and right-sided linear

The \mathcal{H}_0 -couplings are a special case of a **one-sided linear couplings** [Chancelier and De Lara, 2021]

Proposition

Let two **vector spaces** \mathcal{X} and \mathcal{Y} be paired by a **bilinear form** $\langle \cdot, \cdot \rangle$, and let $C \subset \mathcal{X}$ be a **nonempty cone** of \mathcal{X}

The function $c: C \times \mathcal{Y} \rightarrow \mathbb{R}$ is a \mathcal{H}_0 -coupling if and only if

there exists a **0-homogeneous mapping** $\varrho: C \rightarrow \mathcal{X}$

such that

$$c(x, y) = \langle \varrho(x), y \rangle, \quad \forall x \in C, \quad \forall y \in \mathcal{Y}$$

and we denote

$$C = \star_{\varrho}$$

Examples of \mathcal{H}_0 -couplings:
Capra-couplings Chancelier and De Lara [2022a]

Constant Along Primal RAs (Capra) couplings are \mathcal{H}_0 -couplings

[Chancelier and De Lara, 2022a, Definition 8]

Definition

Let $\|\cdot\|$ be a (source) **norm on \mathcal{X}**

The **Capra coupling (Capra)** $\mathcal{X} \overset{\dot{\zeta}}{\longleftrightarrow} \mathcal{Y}$ is given by

$$\forall y \in \mathcal{Y}, \begin{cases} \dot{\zeta}(x, y) = \frac{\langle x, y \rangle}{\|x\|}, \quad \forall x \in \mathcal{X} \setminus \{0\} \\ \dot{\zeta}(0, y) = 0 \end{cases}$$

The coupling Capra is a \mathcal{H}_0 -coupling between \mathcal{X} and \mathcal{Y} itself, as $\dot{\zeta} = \star R_{\|\cdot\|}$ since

$$\dot{\zeta}(x, y) = \langle \underbrace{R_{\|\cdot\|}(x)}_{\substack{\text{radial} \\ \text{projection}}}, y \rangle, \quad \forall x \in \mathcal{X}, \quad \forall y \in \mathcal{X}$$

Examples of \mathcal{H}_0 -couplings:
radial \mathcal{H}_0 -couplings

For any function $f: \mathcal{X} \rightarrow \overline{\mathbb{R}}$, we introduce

the **level sets** $f^{\leq r} = \{x \in \mathcal{X} \mid f(x) \leq r\}$, $\forall r \in \overline{\mathbb{R}}$

the **strict level sets** $f^{< r} = \{x \in \mathcal{X} \mid f(x) < r\}$, $\forall r \in \overline{\mathbb{R}}$

and the **level curves** $f^{=r} = \{x \in \mathcal{X} \mid f(x) = r\}$, $\forall r \in \overline{\mathbb{R}}$

Radial \mathcal{H}_0 -couplings

Definition

We call **normalization function** a 1-homogeneous nonnegative function $\nu: \mathcal{X} \rightarrow [0, +\infty]$ such that $\nu^{\neq 1} \neq \emptyset$

With any normalization function ν , we associate the primal **normalization mapping** $\varrho_\nu: \mathcal{X} \setminus \nu^=0 \rightarrow \mathcal{X}$

defined by $\mathcal{X} \setminus \nu^=0 \ni x \mapsto \varrho_\nu(x) = \frac{1}{\nu(x)}x$

as well as the **radial \mathcal{H}_0 -coupling** \star_{ϱ_ν} , between $\mathcal{X} \setminus \nu^=0$ and \mathcal{Y} ,

as the function $\star_{\varrho_\nu}: (\mathcal{X} \setminus \nu^=0) \times \mathcal{Y} \rightarrow \mathbb{R}$

defined by $\star_{\varrho_\nu}(x, y) = \frac{1}{\nu(x)} \langle x, y \rangle = \langle \varrho_\nu(x), y \rangle$

$$\forall x \in \mathcal{X} \setminus \nu^=0, \forall y \in \mathcal{Y}$$

Capra-couplings are radial \mathcal{H}_0 -couplings

Proposition

Regarding classes of couplings, we have the following strict inclusions

$$\text{Capra} \subsetneq \text{radial } \mathcal{H}_0 \subsetneq \mathcal{H}_0$$

For the proof that $\text{Capra} \subsetneq \text{radial } \mathcal{H}_0$, we will need the following

Definition

The **Minkowski functional** associated with the **subset** $X \subset \mathcal{X}$ is the function $m_X: \mathcal{X} \rightarrow [0, +\infty]$ defined by (with the convention that $\inf \emptyset = +\infty$)

$$m_X(x) = \inf \{ \lambda > 0 \mid x \in \lambda X \}, \quad \forall x \in \mathcal{X}$$

The Minkowski functional m_X is a **1-homogeneous** (nonnegative) function

Proof that Capra-couplings are radial \mathcal{H}_0 -couplings

Proof.

- ▶ Let S denote the **unit sphere of the norm $\|\cdot\|$** and let $\nu = m_S$ be the Minkowski functional of S
- ▶ Thus defined, ν is a normalization function, as an easy calculation shows that

$$\nu = m_S = \|\cdot\| + \iota_{\mathcal{X} \setminus \{0\}}, \quad \nu^{\neq 0} = \emptyset$$

$$(\text{Capra}) \quad \dot{\zeta} = \star_{\varrho_\nu} \quad (\text{radial } \mathcal{H}_0)$$

□

Notice that the norm $\|\cdot\|$ is also a normalization function, but that, as $\|\cdot\|^{\neq 0} = \{0\}$, $\|\cdot\|$ leads to the \mathcal{H}_0 -coupling **between $\mathcal{X} \setminus \{0\}$ and \mathcal{Y}** defined by $\star_{\varrho_{\|\cdot\|}}(x, y) = \langle x, y \rangle / \|x\|$ when $x \neq 0$, which is not a Capra-coupling — as Capra-couplings are defined between \mathcal{X} and \mathcal{Y} — so that $\dot{\zeta} \neq \star_{\varrho_{\|\cdot\|}}$

Conclusion

Fenchel-Moreau conjugate of a function

$$f \in \overline{\mathbb{R}}^{\mathcal{U}} \mapsto f^c \in \overline{\mathbb{R}}^{\mathcal{V}}$$

Definition

The c -Fenchel-Moreau conjugate $f^c: \mathcal{V} \rightarrow \overline{\mathbb{R}}$ of a function $f: \mathcal{U} \rightarrow \overline{\mathbb{R}}$ is defined by

$$f^c(v) = \sup_{u \in \mathcal{U}} \left(c(u, v) \dot{+} (-f(u)) \right), \quad \forall v \in \mathcal{V}$$

We use the Moreau *lower* and *upper* additions on $\overline{\mathbb{R}}$ that extend the usual addition with

$$(+\infty) \dot{+} (-\infty) = (-\infty) \dot{+} (+\infty) = -\infty$$

$$(+\infty) \dot{+} (-\infty) = (-\infty) \dot{+} (+\infty) = +\infty$$

Blanket assumptions

1. Let two **vector spaces** \mathcal{X} and \mathcal{Y} be paired by a **bilinear form** $\langle \cdot, \cdot \rangle$, and let $C \subset \mathcal{X}$ be a **nonempty cone** of \mathcal{X}
2. Let \star_ϱ be a \mathcal{H}_0 -coupling with associated **0-homogeneous mapping** $\varrho: C \rightarrow \mathcal{X}$, satisfying

$$\text{im } \varrho = \varrho(C) \subset C$$

3. Let $f: C \rightarrow \overline{\mathbb{R}}$ be a function satisfying

$$f \circ \varrho = f$$

(hence, necessarily, $f: C \rightarrow \overline{\mathbb{R}}$ is **0-homogeneous**)

\mathcal{H}_0 -conjugates of 0-homogeneous functions

Proposition

Under the blanket assumptions, we have that

$$\underbrace{f^{\star\varrho}}_{\star\varrho\text{-conjugate}} = \underbrace{(f \dot{+} \iota_{\text{im}\varrho})^{\star}}_{\text{Fenchel conjugate}}$$

Capra-conjugate of the ℓ_0 pseudonorm

$S \subset \mathbb{R}^n$ unit sphere, $\nu = m_S$, $\dot{\phi} = \star_{\varrho_\nu}$, $\varrho_\nu(x) = \frac{1}{\nu(x)}x$, $\forall x \in \mathbb{R}^n$,
 $\text{im}_{\varrho_\nu} = S \cup \{0\}$ ($1/\nu(0) = 0$), $C = \mathbb{R}^n$, $f = \ell_0$

$$\begin{aligned}
 \ell_0^{\dot{\phi}}(y) &= \ell_0^{\star_{\varrho_\nu}}(y) = (\ell_0 \dot{+} \iota_{\text{im}_{\varrho_\nu}})^{\star} \\
 &= (\ell_0 \dot{+} \iota_{S \cup \{0\}})^{\star} \\
 &= \sup \left\{ 0, \sup_{s \in S} \{ \langle s \mid y \rangle - \ell_0(s) \} \right\} \\
 &= \sup \left\{ 0, \sup_{i \in [1, n]} \left\{ \underbrace{\sup_{\substack{s \in S \\ \ell_0(s) = i}} \langle s \mid y \rangle}_{\|y\|_{(i)}^{\mathcal{R}}} - i \right\} \right\} \\
 &= \sup_{i \in [1, n]} \left[\|y\|_{(i)}^{\mathcal{R}} - i \right]_+
 \end{aligned}$$

Conclusion

Motivation: duality in convex analysis

Reverse coupling and Fenchel-Moreau biconjugate

With the coupling c , we associate the **reverse coupling** c'

$$c' : \mathcal{V} \times \mathcal{U} \rightarrow \overline{\mathbb{R}}, \quad c'(v, u) = c(u, v), \quad \forall (v, u) \in \mathcal{V} \times \mathcal{U}$$

$$f \in \overline{\mathbb{R}}^{\mathcal{U}} \mapsto f^c \in \overline{\mathbb{R}}^{\mathcal{V}}$$

$$g \in \overline{\mathbb{R}}^{\mathcal{V}} \mapsto g^{c'} \in \overline{\mathbb{R}}^{\mathcal{U}}$$

Reverse coupling and Fenchel-Moreau biconjugate

With the coupling c , we associate the **reverse coupling** c'

$$c' : \mathcal{V} \times \mathcal{U} \rightarrow \overline{\mathbb{R}}, \quad c'(v, u) = c(u, v), \quad \forall (v, u) \in \mathcal{V} \times \mathcal{U}$$

$$f \in \overline{\mathbb{R}}^{\mathcal{U}} \mapsto f^c \in \overline{\mathbb{R}}^{\mathcal{V}}$$

$$g \in \overline{\mathbb{R}}^{\mathcal{V}} \mapsto g^{c'} \in \overline{\mathbb{R}}^{\mathcal{U}}$$

$$g^{c'}(u) = \sup_{v \in \mathcal{V}} \left(c(u, v) \dagger (-g(v)) \right), \quad \forall u \in \mathcal{U}$$

$$f^{cc'}(u) = (f^c)^{c'}(u) = \sup_{v \in \mathcal{V}} \left(c(u, v) \dagger (-f^c(v)) \right), \quad \forall u \in \mathcal{U}$$

\mathcal{H}_0 -biconjugates of 0-homogeneous functions

Proposition

Under the blanket assumptions, we have that

$$f^{*\varrho^{*'}\varrho} = \overbrace{f^{*\varrho^{*'}}}^{\text{convex lsc}} \circ \varrho = (f \dot{+} \iota_{\text{im}\varrho})^{**'} \circ \varrho$$

In generalized convexity,
one defines so-called c -convex functions

$$f \in \overline{\mathbb{R}}^{\mathcal{U}} \mapsto f^c \in \overline{\mathbb{R}}^{\mathcal{V}} \mapsto f^{cc'} \in \overline{\mathbb{R}}^{\mathcal{U}}$$

For any function $f: \mathcal{U} \rightarrow \overline{\mathbb{R}}$, one has that

$$f^{cc'} \leq f$$

Definition

The function $f: \mathcal{U} \rightarrow \overline{\mathbb{R}}$ is said to be c -convex if

$$f^{cc'} = f$$

c-convex functions have dual representations as suprema of elementary functions (abstract convexity)

If the function $f: \mathcal{U} \rightarrow \overline{\mathbb{R}}$ is c-convex, we have that

$$f(u) = \sup_{v \in \mathcal{V}} \underbrace{\left(c(u, v) + (-f^c(v)) \right)}_{\text{elementary function of } u}, \quad \forall u \in \mathcal{U}$$

*Example: \star -convex functions
= closed convex functions
= proper convex lsc or $\equiv -\infty$ or $\equiv +\infty$
= suprema of affine functions*

\star_{ϱ} -convex functions

If the function $f: C \rightarrow \overline{\mathbb{R}}$ is \star_{ϱ} -convex, we have that

$$f(x) = \sup_{y \in \mathcal{Y}} \underbrace{\left(\langle \varrho(x), y \rangle + (-f^{\star_{\varrho}}(y)) \right)}_{\text{affine function of } \varrho(x)}, \quad \forall x \in C$$

Outline of the presentation

Orthant-strict monotonicity and Capra-convexity of l_0

Orthant-strict monotonicity

Conclusion

Motivation: subgradients in convex analysis

Subdifferentials of a conjugacy

For any function $f: \mathcal{U} \rightarrow \overline{\mathbb{R}}$ and $u \in \mathcal{U}, v \in \mathcal{V}$

Definition

Upper subdifferential (following [Martinez-Legaz and Singer, 1995])

$$v \in \partial^c f(u) \iff f(u) = c(u, v) \dot{+} (-f^c(v))$$

The upper subdifferential $\partial^c f$ has the property that

$$\partial^c f(u) \neq \emptyset \implies \underbrace{f(u) = f^{cc'}(u)}_{\text{the function } f \text{ is } c\text{-convex at } u}$$

Definition

Lower subdifferential

$$v \in \partial_c f(u) \iff f^c(v) = c(u, v) \dot{+} (-f(u))$$

\mathcal{H}_0 -subdifferential of 0-homogeneous functions

Proposition

Under the blanket assumptions, we have that

$$\underbrace{\partial_{\star_\varrho} f}_{\star_\varrho\text{-subdifferential}} = \underbrace{\partial(f \dot{+} \iota_{\text{im}\varrho})}_{\text{Moreau-Rockafellar subdifferential}} \circ \varrho$$

Roadmap: convex factorization of the ℓ_0 pseudonorm

Find

- ▶ a **normalization function** $\nu: \mathbb{R}^n \rightarrow [0, +\infty]$
- ▶ a **nonempty cone** $C \subset \mathbb{R}^n \setminus \nu=0$

such that

$$\partial_{\star_{\varrho_\nu}}(\ell_0 + \iota_C)(x) = \partial(\ell_0 + \iota_{\text{im}_{\varrho_\nu}})(\varrho_\nu(x)) \neq \emptyset, \quad \forall x \in C$$

hence that $\ell_0 + \iota_C = \overbrace{(\ell_0 + \iota_C)^{\star_{\varrho_\nu \star'}}}_{\text{convex lsc}} \circ \varrho_\nu = (\ell_0 + \iota_{\text{im}_{\varrho_\nu}})^{\star\star'} \circ \varrho_\nu$
and, in particular, when $C = \mathbb{R}^n$,

$$\ell_0 = \underbrace{\ell_0^{\star_{\varrho_\nu \star'}}}_{\text{convex lsc } \mathcal{L}_0^\nu} \circ \varrho_\nu = (\ell_0 + \iota_{\text{im}_{\varrho_\nu}})^{\star\star'} \circ \varrho_\nu$$

Conclusion

Polar transform of a function

The **polar set** X° of the subset $X \subset \mathbb{R}^n$ is the closed convex set

$$X^\circ = \{y \in \mathbb{R}^n \mid \langle x \mid y \rangle \leq 1, \forall x \in X\}$$

The bipolar theorem states that $X^{\circ\circ} = \overline{\text{co}}(X \cup \{0\})$

Definition

For any function $f : \mathbb{R}^n \rightarrow \overline{\mathbb{R}}_+$, we introduce the **polar transform** $f^\circ : \mathbb{R}^n \rightarrow \overline{\mathbb{R}}_+$ defined by

$$f^\circ(y) = \sup_{x \in \mathbb{R}^n} \left(\langle x, y \rangle_+ \times (f(x))^{-1} \right), \quad \forall y \in \mathbb{R}^n$$

where $0 \times (+\infty) = +\infty$

Polar transform of Minkowski and support functions

If $\nu: \mathbb{R}^n \rightarrow [0, +\infty]$ is 1-homogeneous, we have that

$$\begin{aligned}\nu &= m_{\nu \leq 1} \\ \nu^\circ &= m_{(\nu \leq 1)^\circ} = \sigma_{(\nu \leq 1)^{\circ\circ}} && \text{convex lsc} \\ \nu^{\circ\circ} &= m_{(\nu \leq 1)^{\circ\circ}} = \sigma_{(\nu \leq 1)^\circ} && \text{convex lsc}\end{aligned}$$

Example

When $\|\cdot\|$ is norm on \mathbb{R}^n , with unit sphere S , unit ball B and dual norm $\|\cdot\|_*$

$$\begin{aligned}\nu &= m_S = \|\cdot\| + \iota_{\mathcal{X} \setminus \{0\}} \\ \nu^{\leq 1} &= B \setminus \{0\}, \quad (\nu^{\leq 1})^\circ = B^\circ, \quad (\nu^{\leq 1})^{\circ\circ} = B \\ \nu^\circ &= m_{B^\circ} = \sigma_B = \|\cdot\|_* \\ \nu^{\circ\circ} &= m_B = \sigma_{B^\circ} = \|\cdot\|\end{aligned}$$

Convex factorization of the l_0 pseudonorm

Theorem

Let $Y \subset \mathbb{R}^n$ be a compact subset such that $Y^{\odot\odot} = Y$
and that the sets Y and Y^\odot are **orthant-strictly monotonic**
Let us define

the function $\nu = m_{Y^\odot \setminus \{0\}}$

the cone $C = \{0\} \cup \mathbb{R}^n \setminus Y^\ominus$

Then, ν is a normalization function, and

$$\partial_{\star_{e\nu}}(l_0 + \nu_C)(x) \neq \emptyset, \quad \forall x \in C$$

hence

$$l_0(x) = \overbrace{\mathcal{L}_0^\nu}^{\text{convex lsc}} \left(\frac{x}{\nu(x)} \right), \quad \forall x \in C$$

Conclusion

Graph of the Euclidean ℓ_0 -cup function \mathcal{L}_0

Orthant-strictly monotonic norms and hidden convexity in the ℓ_0 pseudonorm

[Chancelier and De Lara, 2022b]

Theorem

If **both** the **norm** $\|\cdot\|$ and the **dual norm** $\|\cdot\|_*$ are **orthant-strictly monotonic**, there exists a **proper convex lsc function** \mathcal{L}_0 , the ℓ_0 -cup function, with domain the unit ball B , such that

$$\ell_0(x) = \underbrace{\mathcal{L}_0}_{\substack{\text{convex lsc} \\ \text{function}}} \left(\frac{x}{\|x\|} \right), \quad \forall x \in \mathbb{R}^n \setminus \{0\}$$

and, as a consequence, the ℓ_0 **pseudonorm coincides**, on the **unit sphere** S , with the proper convex lsc function \mathcal{L}_0

$$\ell_0(x) = \mathcal{L}_0(x), \quad \forall x \in S$$

The ℓ_0 -cup function as a convex envelope

Proposition

The proper convex lsc function \mathcal{L}_0 is the convex envelope of the following piecewise constant function

$$\mathcal{L}_0(x) = \begin{cases} 0 & \text{if } x = 0, \\ \ell & \text{if } x \in B_{(\ell)}^{\text{T}^*} \setminus B_{(\ell-1)}^{\text{T}^*}, \ell \in \llbracket 1, n \rrbracket \\ +\infty & \text{if } x \notin B_{(n)}^{\text{T}^*} = B \end{cases}$$

The ℓ_0 -cup function as best proper convex lsc lower approximation of the ℓ_0 pseudonorm on the unit ball

Theorem

The ℓ_0 -cup function \mathcal{L}_0 is the best convex lsc lower approximation of the ℓ_0 pseudonorm on the unit ball B

$$\text{best convex lsc function} \quad \mathcal{L}_0(x) \leq \ell_0(x), \quad \forall x \in B$$

and, as seen above, coincides with the ℓ_0 pseudonorm

on the unit sphere S

$$\ell_0(x) = \mathcal{L}_0(x), \quad \forall x \in S$$

Tightest closed convex function below the ℓ_0 pseudonorm
on the ℓ_p -unit balls on \mathbb{R}^2 for $p \in \{1, 1.1, 2, 4, 300, \infty\}$

The Capra-convex functions are 0-homogeneous and coincide, on the unit sphere, with a closed convex function

Proposition

\dot{c} -convexity of the function $h: \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$

$$\iff h = h^{\dot{c}\dot{c}'}$$

$$\iff h = \underbrace{(h^{\dot{c}})^{\star'}}_{\text{convex lsc function}} \circ R_{\|\cdot\|}$$

\iff **hidden convexity** in the function $h: \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$

there exists a **closed convex function** $f: \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$

such that $h = f \circ R_{\|\cdot\|}$, that is, $h(x) = f\left(\frac{x}{\|x\|}\right)$

[Chancelier and De Lara, 2022b]

Theorem

If **both** the **norm** $\|\cdot\|$ and the **dual norm** $\|\cdot\|_*$ are **orthant-strictly monotonic**, we have that

$$\partial_{\dot{C}} l_0(x) \neq \emptyset, \quad \forall x \in \mathbb{R}^n,$$

and, as a consequence,

$$l_0^{\dot{C}\dot{C}'} = l_0$$

and thus

$$l_0 = l_0^{\dot{C}\dot{C}'} = l_0^{\dot{C}\star'} \circ R_{\|\cdot\|} = \underbrace{(l_0^{\dot{C}})^{\star'}}_{\text{convex lsc function } \mathcal{L}_0} \circ \underbrace{R_{\|\cdot\|}}_{\text{radial projection}}$$

Variational formulas for the ℓ_0 pseudonorm

[Chancelier and De Lara, 2022b]

Proposition

If **both** the **norm** $\|\cdot\|$ and the **dual norm** $\|\cdot\|_*$ are **orthant-strictly monotonic**, we have that

$$\ell_0(x) = \frac{1}{\|x\|} \min_{\substack{x^{(1)} \in \mathbb{R}^n, \dots, x^{(n)} \in \mathbb{R}^n \\ \sum_{\ell=1}^n \|x^{(\ell)}\|_{(\ell)}^{\top*} \leq \|x\| \\ \sum_{\ell=1}^n x^{(\ell)} = x}} \sum_{\ell=1}^n \ell \|x^{(\ell)}\|_{(\ell)}^{\top*}, \quad \forall x \in \mathbb{R}^n$$

$$\ell_0(x) = \sup_{y \in \mathbb{R}^n} \inf_{\ell \in [1, n]} \left(\frac{\langle x | y \rangle}{\|x\|} - \left[\|y\|_{(\ell)}^{\top} - \ell \right]_+ \right), \quad \forall x \in \mathbb{R}^n \setminus \{0\}$$

Orthant-strict monotonicity and Capra-convexity of l_0

Orthant-strict monotonicity

Conclusion

We reformulate sparsity in terms of coordinate subspaces

$$y = (*, *, *, *, *, *) \rightarrow \pi_{\{2,4,5\}}(y) = (0, *, 0, *, *, 0) \in \mathcal{R}_{\{2,4,5\}}$$

- ▶ For any subset $K \subset \llbracket 1, n \rrbracket$ of indices, we set

$$\mathcal{R}_K = \{y \in \mathbb{R}^n \mid y_j = 0, \forall j \notin K\} \subset \mathbb{R}^n$$

- ▶ The connection with the **level sets** of the ℓ_0 pseudonorm is

$$\ell_0^{\leq k} = \underbrace{\{x \in \mathbb{R}^n \mid \ell_0(x) \leq k\}}_{k\text{-sparse vectors}} = \bigcup_{|K| \leq k} \mathcal{R}_K, \quad \forall k \in \llbracket 0, n \rrbracket$$

- ▶ We denote by $\pi_K : \mathbb{R}^n \rightarrow \mathcal{R}_K$ the **orthogonal projection**

For any vector $y \in \mathbb{R}^n$, $\pi_K(y) = y_K \in \mathcal{R}_K \subset \mathbb{R}^n$ is the vector whose entries **coincide** with those of y , **except** for those **outside of K** that **vanish**

Orthant-monotonic norms and sets

Orthant-monotonic norms

For any $x \in \mathbb{R}^n$, we denote by $|x|$
the vector of \mathbb{R}^n with components $|x_i|$, $i \in \llbracket 1, n \rrbracket$

Definition

A norm $\|\cdot\|$ on the space \mathbb{R}^n is called **orthant-monotonic** [Gries, 1967] if, for all x, x' in \mathbb{R}^n , we have

$$|x| \leq |x'| \text{ and } x \circ x' \geq 0 \implies \|x\| \leq \|x'\|$$

where $x \circ x' = (x_1x'_1, \dots, x_nx'_n)$
is the Hadamard (entrywise) product

$$\text{and } \left. \begin{array}{l} |x_1| \leq |x'_1|, \dots, |x_n| \leq |x'_n| \\ x_1x'_1 \geq 0, \dots, x_nx'_n \geq 0 \end{array} \right\} \implies \|x\| \leq \|x'\|$$

Example of unit sphere of a non orthant-monotonic norm

In the bottom right orthant,
consider

$$|(0, -1)| \leq |(0.5, -1)|$$

and

$$(0, -1) \circ (0.5, -1) \geq (0, 0)$$

but

$$1 = \|(0, -1)\| > \|(0.5, -1)\|$$

We define orthant-monotonic sets

Definition

The closed convex subset $X \subset \mathbb{R}^n$ is said to be **orthant-monotonic** if it satisfies any one of the equivalent conditions

1. $\sigma_X \circ \pi_K \leq \sigma_X$, for all $K \subset \llbracket 1, n \rrbracket$
2. $\pi_K(X) \subset X$, for all $K \subset \llbracket 1, n \rrbracket$
3. $\pi_K(X) \subset X \cap \mathcal{R}_K$, for all $K \subset \llbracket 1, n \rrbracket$
4. $\pi_K(X) = X \cap \mathcal{R}_K$, for all $K \subset \llbracket 1, n \rrbracket$

[Chancelier and De Lara, 2023]

Orthant-strictly monotonic (OSM) norms and sets

Orthant-strictly monotonic norms

[Chancelier and De Lara, 2023]

Definition

A norm $\|\cdot\|$ on the space \mathbb{R}^n is called **orthant-strictly monotonic** if, for all x, x' in \mathbb{R}^n , we have

$$|x| < |x'| \text{ and } x \circ x' \geq 0 \implies \|x\| < \|x'\|$$

where $|x| < |x'|$ means that there exists $j \in \llbracket 1, n \rrbracket$ such that $|x_j| < |x'_j|$

Intuition: $\epsilon \neq 0 \implies \|(0, *, 0, *, *, 0)\| < \|(0, *, \epsilon, *, *, 0)\|$

An orthant-strictly monotonic norm is orthant-monotonic

Examples of orthant-strictly monotonic norms

$$\|x\|_\infty = \sup_{i \in \llbracket 1, n \rrbracket} |x_i| \quad \text{and} \quad \|x\|_p = \left(\sum_{i=1}^n |x_i|^p \right)^{1/p} \quad \text{for } p \in [1, \infty[$$

with unit ball B_p and unit sphere S_p

- ▶ All the ℓ_p -norms $\|\cdot\|_p$ on the space \mathbb{R}^n , for $p \in [1, \infty[$, are monotonic, hence **orthant-monotonic**

$$\ell_1, \ell_2, \ell_\infty$$

- ▶ All the ℓ_p -norms $\|\cdot\|_p$ on the space \mathbb{R}^n , for $p \in [1, \infty[$, are **orthant-strictly monotonic**

$$\ell_1, \ell_2, \cancel{\ell_\infty}$$

$$|\epsilon| < 1 \implies \|(1, 0)\|_\infty = 1 = \|(1, \epsilon)\|_\infty$$

We define orthant-strictly monotonic sets

Definition

The closed convex subset $X \subset \mathbb{R}^n$ is said to be orthant-strictly monotonic (OSM) if it satisfies

$$\sigma_X(y) < +\infty \text{ and } y \neq \pi_K y \implies \sigma_X(\pi_K y) < \sigma_X(y)$$

An orthant-strictly monotonic set is orthant-monotonic

Conclusion

- ▶ We have introduced \mathcal{H}_0 -couplings, and indicated in what they are suitable tool for convex factorization of 0-homogeneous functions
- ▶ We have recalled Capra-couplings, induced by a norm, and how they reveal convex factorization of the ℓ_0 pseudonorm on the unit ball, when both the norm and the dual norm are orthant-strictly monotonic (OSM)
- ▶ We have generalized the notion of OSM and, using radial \mathcal{H}_0 -couplings, we expect to display convex factorization of ℓ_0 on bipolar subsets (closed convex sets that contain 0) that are more general than unit balls (not necessarily symmetric, 0 is not necessarily in the interior)
