# Ingredients for a general optimization problem

$$\inf_{u \in U^{ad}} J(u)$$

- ▶ **Optimization space**  $\mathcal{U}$ , **optimization variables**  $u \in \mathcal{U}$
- ▶ **Constraints**  $u \in U^{ad} \subset \mathcal{U}$  (admissible set)
- ▶ **Criterion**  $J : \mathcal{U} \rightarrow \mathbb{R} \cup \{+\infty\}$

As a remark, we have

$$\inf_{u \in U^{ad}} J(u) = \inf_{u \in \mathcal{U}} \left( J(u) + \iota_{U^{ad}}(u) \right)$$

$\iota_{U^{ad}}$  being the **indicator function** of the set  $U^{ad}$

$$\iota_{U^{ad}}(u) = \begin{cases} 0 & \text{if } u \in U^{ad} \\ +\infty & \text{if } u \notin U^{ad} \end{cases}$$

# Some classes of optimization problems in finite dimension

$$\inf_{u \in U^{ad}} J(u)$$

- ▶ **Linear** programming
  - ▶ Optimization space  $\mathcal{U} = \mathbb{R}^N$
  - ▶ Criterion  $J$  is linear (affine)
  - ▶ Constraint set  $U^{ad}$  defined by a finite number of linear equations (equalities and inequalities)
  
- ▶ **Combinatorial** optimization
  - ▶ Optimization space  $\mathcal{U}$  is discrete (binary  $\{0, 1\}^N$ , integer  $\mathbb{Z}^N$ , etc.)
  
- ▶ **Convex** optimization
  - ▶ Optimization space  $\mathcal{U} = \mathbb{R}^N$
  - ▶ Criterion  $J$  is a convex function
  - ▶ Constraint set  $U^{ad}$  is convex

# Some useful formulas in optimization

- **Linearity formula.** For any function  $f : \mathcal{X} \rightarrow \mathbb{R} \cup \{+\infty\}$  we have

$$\inf_{x \in \mathcal{X}} (a + f(x)) = a + \inf_{x \in \mathcal{X}} f(x), \quad \forall a \in \mathbb{R}$$
$$\inf_{x \in \mathcal{X}} \alpha f(x) = \alpha \inf_{x \in \mathcal{X}} f(x), \quad \forall \alpha \geq 0$$

- **Tower formula.** For any function  $h : \mathcal{X} \times \mathcal{Y} \rightarrow \mathbb{R} \cup \{+\infty\}$  we have

$$\inf_{(x,y) \in \mathcal{X} \times \mathcal{Y}} h(x,y) = \inf_{x \in \mathcal{X}} (\inf_{y \in \mathcal{Y}} h(x,y)) = \inf_{y \in \mathcal{Y}} (\inf_{x \in \mathcal{X}} h(x,y))$$

- **Interchange formula.** For any function  $f : \mathcal{X} \rightarrow \mathbb{R} \cup \{+\infty\}$  and any function  $g : \mathcal{Y} \rightarrow \mathbb{R} \cup \{+\infty\}$  we have

$$\inf_{(x,y) \in \mathcal{X} \times \mathcal{Y}} (f(x) + g(y)) = \inf_{x \in \mathcal{X}} f(x) + \inf_{y \in \mathcal{Y}} g(y)$$

## Exercise\*

*Give proofs for the tower and interchange formulas*

# Interchange in a stochastic framework

Consider a finite set  $\mathbb{S}$  of **scenarios** equipped with a **probability**<sup>1</sup>  $\{\pi_s\}_{s \in \mathbb{S}}$ . For each scenario  $s \in \mathbb{S}$ , we have

- ▶ a cost function  $f_s : \mathcal{X}_s \rightarrow \mathbb{R} \cup \{+\infty\}$
- ▶ depending on a control  $x_s \in \mathcal{X}_s$

We have

$$\inf_{\{x_s\}_{s \in \mathbb{S}} \in \prod_{s \in \mathbb{S}} \mathcal{X}_s} \left( \sum_{s \in \mathbb{S}} \pi_s f_s(x_s) \right) = \sum_{s \in \mathbb{S}} \pi_s \left( \inf_{x_s \in \mathcal{X}_s} f_s(x_s) \right)$$

that is, the operator **inf** and the operator  $\mathbb{E}$  can be interchanged.

---

<sup>1</sup>that is,  $\pi_s \geq 0$  and  $\sum_{s \in \mathbb{S}} \pi_s = 1$

# Convex sets

Let  $N \in \mathbb{N}^*$ . We consider sets of the Euclidian space  $\mathbb{R}^N$

- ▶ The set  $C \subset \mathbb{R}^N$  is **convex** if we have

$$\forall (x_1, x_2) \in C \times C, \forall t \in [0, 1], tx_1 + (1 - t)x_2 \in C$$

- ▶ A **segment** is convex
- ▶ A **hyperplane**<sup>2</sup> is convex
- ▶ An **affine subspace**<sup>3</sup> is convex
- ▶ An **intersection of convex sets** is convex

## Exercise\*

*Give the proof of the last statement*

---

<sup>2</sup>Hyperplane  $H = \{x \in \mathbb{R}^N \mid \langle x, y \rangle + b = 0\}$  with  $y \in \mathbb{R}^N \setminus \{0\}$  and  $b \in \mathbb{R}$

<sup>3</sup>intersection of hyperplanes

# Definitions of convex functions

Let  $C \subset \mathbb{R}^N$  be a nonempty **convex** set of  $\mathbb{R}^N$ , where  $N \in \mathbb{N}^*$ , and  $f : C \rightarrow \mathbb{R}$  be a function

- ▶ The function  $f$  is **convex on  $C$**  if, for any  $x_1 \in C$ ,  $x_2 \in C$  and any  $t \in [0, 1]$ ,

$$f(tx_1 + (1 - t)x_2) \leq tf(x_1) + (1 - t)f(x_2)$$

- ▶ The function  $f$  is **strictly convex on  $C$**  if, for any  $x_1 \in C$ ,  $x_2 \in C$ ,  $x_1 \neq x_2$ , and any  $t \in ]0, 1[$ ,

$$f(tx_1 + (1 - t)x_2) < tf(x_1) + (1 - t)f(x_2)$$

- ▶ The function  $f$  is  **$a$ -strongly convex on  $C$**  (of modulus  $a > 0$ ) if, for any  $x_1 \in C$ ,  $x_2 \in C$  and any  $t \in [0, 1]$ ,

$$f(tx_1 + (1 - t)x_2) \leq tf(x_1) + (1 - t)f(x_2) - \frac{a}{2}t(1 - t)\|x_1 - x_2\|^2$$

## Exercises

Let  $C \subset \mathbb{R}^N$  be a nonempty set of  $\mathbb{R}^N$ , where  $N \in \mathbb{N}^*$

- ▶ Show that a function  $f : C \rightarrow \mathbb{R}$  is convex if and only if its epigraph<sup>4</sup> is a convex set of  $\mathbb{R}^N \times \mathbb{R}$
- ▶ Show that a function  $f : C \rightarrow \mathbb{R}$  is  $a$ -strongly convex if and only if  $g(x) = f(x) - \frac{a}{2}\|x\|^2$  is convex
- ▶ If  $f : C \rightarrow \mathbb{R}$  is convex, show that  $f$  is not strictly convex if and only if there exists a nonempty convex set  $C' \subset C$  over which  $f$  is affine

---

<sup>4</sup>epif =  $\{(x, y) \in \mathbb{R}^N \times \mathbb{R} \mid f(x) \leq y\} \subset \mathbb{R}^N \times \mathbb{R}$

# Convexity for differentiable multivariate functions

The **Hessian** matrix  $\mathcal{H}_f(x)$  of a **twice differentiable** ( $C^2$ ) function  $f : \mathbb{R}^N \rightarrow \mathbb{R}$  is the  $N \times N$  symmetric matrix given by

$$\mathcal{H}_f(x) = \left\{ \frac{\partial^2 f}{\partial x_i \partial x_j}(x) \right\}_{(i,j) \in \{1, \dots, N\}^2}$$

## Proposition

Let  $C \subset \mathbb{R}^N$  be an **nonempty convex set** of  $\mathbb{R}^N$ , where  $N \in \mathbb{N}^*$

- ▶ A  $C^2$  function  $f : \mathbb{R}^N \rightarrow \mathbb{R}$  is **convex** on  $C$  if and only if the Hessian matrix  $\mathcal{H}_f(x)$  is **positive** for all  $x \in C$
- ▶ A  $C^2$  function  $f : \mathbb{R}^N \rightarrow \mathbb{R}$  is **a-strongly convex** on  $C$  if and only if the **eigenvalues** of the Hessian matrix  $\mathcal{H}_f(x)$  are uniformly bounded below by  $a > 0$  on  $C$

## Exercise

Let  $Q$  be a  $N \times N$  symmetric matrix and  $f(x) = \frac{1}{2}x^\top Qx$ , where  $x^\top$  is the transpose of the vector  $x$ . Give conditions on the smallest eigenvalue of  $Q$  so that the function  $f$  is convex, or strictly convex, or a-strongly convex

# Operations preserving convexity

## Proposition

Let  $(f_i)_{i \in I}$  be a family of convex functions indexed by  $i \in I$   
Then  $\sup_{i \in I} f_i$  is a convex function

## Proposition

Let  $(f_i)_{i=1, \dots, n}$  be convex functions  
Let  $(\alpha_i)_{i=1, \dots, n}$  be nonnegative numbers  
Then  $\sum_{i=1}^n \alpha_i f_i$  is a convex function

## Proposition

Let  $f : \mathbb{R}^N \rightarrow \mathbb{R}$  be convex  
Let  $A$  be a  $N \times M$  matrix and  $b \in \mathbb{R}^N$   
Then  $y \in \mathbb{R}^M \mapsto f(Ay + b)$  is a convex function

# Minimum

## Definition

We say that  $u^* \in \mathcal{U}$  is a **global minimum** of the optimization problem

$$\inf_{u \in U^{ad}} J(u)$$

if we have

$$u^* \in U^{ad} \quad \text{and} \quad J(u^*) \leq J(u), \quad \forall u \in U^{ad}$$

In this case, we write

$$J(u^*) = \min_{u \in U^{ad}} J(u)$$

# Existence and uniqueness of a minimum

We consider the finite dimensional optimization problem

$$\inf_{u \in U^{ad}} J(u) \quad \text{with} \quad U^{ad} \subset \mathcal{U} = \mathbb{R}^N$$

## Proposition

If the constraint set  $U^{ad}$  is **compact** (bounded and closed) and if the criterion  $J$  is **continuous**, then there exists a global minimum

## Proposition

If the constraint set  $U^{ad}$  is **closed** and if the criterion  $J$  is **continuous** and **coercive** on  $U^{ad}$ , then there exists a global minimum

## Proposition

If the constraint set  $U^{ad}$  is **closed and convex** and if the criterion  $J$  is **strictly convex**, then the global minimum (if it exists) is unique

## Exercise

We consider the optimization problem

$$\inf_{u \in U^{ad}} J(u)$$

Give an example

- ▶ of continuous criterion  $J$  and of constraint set  $U^{ad}$  for which there is no minimum
- ▶ of criterion  $J$  and of compact constraint set  $U^{ad}$  for which there is no minimum
- ▶ of continuous criterion  $J$  and of unbounded and closed constraint set  $U^{ad}$  for which there is no minimum
- ▶ of convex criterion  $J$  and of constraint set  $U^{ad}$  for which there is more than one minimum
- ▶ of strictly convex criterion  $J$  and of constraint set  $U^{ad}$  for which there is more than one minimum

# Local minimum

## Definition

We say that  $u^* \in \mathcal{U}$  is a **local minimum** of the optimization problem

$$\inf_{u \in U^{ad}} J(u)$$

if there exists a neighborhood  $\mathcal{V}$  of  $u^*$  in  $U^{ad}$  such that

$$u^* \in U^{ad} \text{ and } J(u^*) \leq J(u), \quad \forall u \in \mathcal{V}$$

## Proposition

If the constraint set  $U^{ad}$  is **convex** and if the criterion  $J$  is **convex**, then a local minimum is a global minimum

# Outline of the presentation

Optimization problems, convex functions, local and global minima

- Uzawa algorithm

- Augmented Lagrangian

# Optimization over an admissible set

We consider the optimization problem

$$\inf_{u \in U^{ad}} J(u)$$

From now,  $U^{ad}$  is a **non empty convex** set of  $\mathbb{R}^N$

In the case where function  $J$  is **differentiable**, we denote by  $\nabla J(u) \in \mathbb{R}^N$  its **gradient** at point  $u$ :

$$\lim_{t>0, t \rightarrow 0} \frac{J(u + td) - J(u)}{t} = \nabla J(u)^\top d, \quad \forall d \in \mathbb{R}^N$$

# First-order optimality conditions

## Proposition

Assume that  $J$  is **differentiable** and  $U^{ad}$  is a **convex** set. Let  $u^* \in U^{ad}$ . Then a **necessary condition** for  $u^*$  to be a **local minimum** of  $J$  over the set  $U^{ad}$  is that

$$\nabla J(u^*)^\top (u - u^*) \geq 0 \quad \forall u \in U^{ad}$$

## Exercise\*

Show that, in the case where  $U^{ad} = \mathbb{R}^N$ , this optimality condition reduces to the **standard stationarity condition**  $\nabla J(u^*) = 0$

## Proposition

Assume moreover that  $J$  is a **convex** function. Let  $u^* \in U^{ad}$ . Then a **sufficient condition** for  $u^*$  to be a **global minimum** of  $J$  over the set  $U^{ad}$  is that

$$\nabla J(u^*)^\top (u - u^*) \geq 0 \quad \forall u \in U^{ad}$$

# Standard projected gradient algorithm

We suppose that  $J$  is differentiable with gradient Lipschitz of modulus  $L$ ,<sup>5</sup>  $a$ -strongly convex and that  $U^{ad}$  is a convex set

Then, for a step size  $\rho$  such that

$$0 < \rho < 2a/L^2$$

the following algorithm converges towards the unique minimum  $u^*$  of

$$\inf_{u \in U^{ad}} J(u)$$

**Data:** Initial control  $u^{(0)}$ , step  $\rho$

**Result:** optimal control  $u^*$

**repeat**

|  $u^{(k+1)} = \text{proj}_{U^{ad}} (u^{(k)} - \rho \nabla J(u^{(k)}))$  (gradient step w.r.t.  $u$ )

**until** some convergence criterion is met;

**Algorithm 1:** Projected gradient algorithm

<sup>5</sup>that is,  $\|\nabla J(u) - \nabla J(v)\| \leq L\|u - v\|$

Lagrangian duality under equality constraints

Uzawa algorithm

Augmented Lagrangian

# Optimization under equality constraints

We consider the optimization problem

$$\inf_{u \in \mathbb{R}^N} J(u)$$

under the **explicit constraint**

$$\Theta(u) = 0$$

where  $\Theta$  is a function with values in  $\mathbb{R}^M$

$$\Theta = (\Theta_1, \dots, \Theta_M) : \mathbb{R}^N \rightarrow \mathbb{R}^M$$

whose components are  $\Theta_j : \mathbb{R}^N \rightarrow \mathbb{R}$ ,  $j = 1, \dots, M$

Otherwise stated, the **admissible set**  $U^{\text{ad}}$  is in this case

$$U^{\text{ad}} = \left\{ u \in \mathbb{R}^N \mid \Theta(u) = 0 \right\}$$

# Sufficient condition for qualification

## Definition

Let  $u^* \in \mathbb{R}^N$ . The equality constraints  $\Theta(u) = 0$  are said to be **regular** at  $u^*$  if, when  $\Theta(u^*) = 0$ , the function  $\Theta$  is differentiable at  $u^*$  and the vectors  $\nabla\Theta_j(u^*)$ ,  $j \in \{1, \dots, M\}$ , are **linearly independent**

Let  $u^* \in \mathbb{R}^N$ . In case

- ▶ either the equality constraints  $\Theta(u) = 0$  are **regular** at  $u^*$
- ▶ or the function  $\Theta$  is **affine**

we say that the equality constraints  $\Theta(u) = 0$  are **qualified** at  $u^*$

# First-order necessary optimality conditions

## Proposition

Let  $u^* \in \mathbb{R}^N$ . We suppose that

- ▶ the criterion  $J$  and the constraints  $\Theta$  are **differentiable**
- ▶ the equality constraints  $\Theta(u) = 0$  are **qualified** at  $u^*$

Then a **necessary condition** for  $u^*$  to be a **local minimum** of  $J$  over the set  $U^{\text{ad}} = \{u \in \mathbb{R}^N \mid \Theta(u) = 0\}$  is that there exists a vector  $\lambda^*$  of  $\mathbb{R}^M$ , called **Lagrange multiplier**, such that

$$\nabla J(u^*) + [\Theta'(u^*)]^\top \lambda^* = 0 \quad \text{and} \quad \Theta(u^*) = 0$$

These first-order optimality conditions are called **Karush-Kuhn-Tucker (KKT) optimality conditions** (specialized for equality constraints)

# First-order sufficient optimality conditions

## Proposition

Let  $u^* \in \mathbb{R}^N$ . We suppose that

- ▶ the criterion  $J$  is **convex and differentiable**
- ▶ the function  $\Theta$  is **affine**

Then a **sufficient condition** for  $u^*$  to be a **global minimum** of  $J$  over the set  $U^{\text{ad}} = \{u \in \mathbb{R}^N \mid \Theta(u) = 0\}$  is that there exists a vector  $\lambda^*$  of  $\mathbb{R}^M$ , called **Lagrange multiplier**, such that

$$\nabla J(u^*) + [\Theta'(u^*)]^\top \lambda^* = 0 \quad \text{and} \quad \Theta(u^*) = 0$$

Remark. Using the **Lagrangian** function  $L(u, \lambda) = J(u) + \lambda^\top \Theta(u)$ ,<sup>6</sup> the conditions above can be written as

$$\begin{aligned}\nabla_u L(u^*, \lambda^*) &= \nabla J(u^*) + [\Theta'(u^*)]^\top \lambda^* = 0 \\ \nabla_\lambda L(u^*, \lambda^*) &= \Theta(u^*) = 0\end{aligned}$$

The first-order optimality conditions express the **stationarity** of the **Lagrangian**

# Duality gap

Consider a function  $\phi : \mathcal{X} \times \mathcal{Y} \rightarrow \mathbb{R}$  and two sets  $X \subset \mathcal{X}$  and  $Y \subset \mathcal{Y}$

We **minimize** in the variable  $x$  and **maximize** in the variable  $y$

## Definition

$$\inf_{x \in X} \sup_{y \in Y} \phi(x, y) - \sup_{y \in Y} \inf_{x \in X} \phi(x, y)$$

is called the **duality gap**

## Proposition

The **duality gap** is **always** positive, that is,

$$\inf_{x \in X} \sup_{y \in Y} \phi(x, y) \geq \sup_{y \in Y} \inf_{x \in X} \phi(x, y)$$

### Exercise\*

Give a proof of the proposition

# Saddle-point

Consider a function  $\phi : \mathcal{X} \times \mathcal{Y} \rightarrow \mathbb{R}$  and two sets  $X \subset \mathcal{X}$  and  $Y \subset \mathcal{Y}$

## Definition

We say that  $(\bar{x}, \bar{y}) \in X \times Y$  is a **saddle-point** of  $\phi$  on  $X \times Y$  if

- ▶  $y \mapsto \phi(\bar{x}, y)$  achieves its **maximum** on  $Y$  at  $\bar{y}$
- ▶  $x \mapsto \phi(x, \bar{y})$  achieves its **minimum** on  $X$  at  $\bar{x}$

or, equivalently

$$\phi(x, \bar{y}) \geq \phi(\bar{x}, \bar{y}) \geq \phi(\bar{x}, y), \quad \forall (x, y) \in X \times Y$$

## Proposition

When there exists a **saddle-point**, there is no **duality gap** (that is, the duality gap is equal to zero)

### Exercise\*

*Give a proof of the proposition*

# Existence of a saddle point

Consider a function  $\phi : \mathcal{X} \times \mathcal{Y} \rightarrow \mathbb{R}$  and two sets  $X \subset \mathcal{X}$  and  $Y \subset \mathcal{Y}$

## Proposition

Suppose that function  $\phi$  is

- ▶ **continuous**
- ▶ **convex** in the variable  $x$
- ▶ **concave** in the variable  $y$

and that  $X$  and  $Y$  are **convex closed sets** such that

- ▶ there exists a  $\hat{y} \in Y$  such that  $\lim_{\|x\| \rightarrow +\infty} \phi(x, \hat{y}) = +\infty$ ,  
or the set  $X$  is bounded
- ▶ there exists a  $\hat{x} \in X$  such that  $\lim_{\|y\| \rightarrow +\infty} \phi(\hat{x}, y) = -\infty$ ,  
or the set  $Y$  is bounded

Then, there exists a **saddle point** for the function  $\phi$  on  $X \times Y$

# Optimization under equality constraints

We consider the **original optimization problem**

$$\inf_{u \in \mathbb{R}^N} J(u)$$

under the **equality constraint**

$$\Theta(u) = 0$$

where  $\Theta = (\Theta_1, \dots, \Theta_M) : \mathbb{R}^N \rightarrow \mathbb{R}^M$

# Lagrangian

## Definition

The **Lagrangian**  $L : \mathbb{R}^N \times \mathbb{R}^M \rightarrow \mathbb{R}$  is defined by

$$L(u, \lambda) = J(u) + \lambda^\top \Theta(u) = J(u) + \sum_{j=1}^M \lambda_j \Theta_j(u)$$

The variables  $\lambda \in \mathbb{R}^M$  are called **(Lagrange) multipliers**

# Primal problem

## Definition

The **primal** optimization problem is

$$\inf_{u \in \mathbb{R}^N} \sup_{\lambda \in \mathbb{R}^M} L(u, \lambda) = \inf_{u \in \mathbb{R}^N} \sup_{\lambda \in \mathbb{R}^M} \left( J(u) + \sum_{j=1}^M \lambda_j \Theta_j(u) \right)$$

## Proposition

The **original** and the **primal** problems have the **same solutions** (in  $u \in \mathbb{R}^N$ )

### Exercise\*

*Give a proof of the proposition*

# Dual problem

## Definition

The **dual optimization problem** is

$$\sup_{\lambda \in \mathbb{R}^M} \inf_{u \in \mathbb{R}^N} L(u, \lambda) = \sup_{\lambda \in \mathbb{R}^M} \inf_{u \in \mathbb{R}^N} \left( J(u) + \sum_{j=1}^M \lambda_j \Theta_j(u) \right)$$

## Definition

The **dual function** is  $\psi : \mathbb{R}^M \rightarrow \mathbb{R} \cup \{-\infty\}$  given by

$$\psi(\lambda) = \inf_{u \in \mathbb{R}^N} L(u, \lambda) \quad (1)$$

hence is concave

## Proposition

When there exists a saddle-point for the Lagrangian, **primal** and **dual** problems are **equivalent** (no duality gap)

# First-order optimality conditions and saddle point

## Proposition

We suppose that

- ▶ the criterion  $J$  is **differentiable** and **convex**
- ▶ the function  $\Theta$  is **affine**

Let  $u^* \in \mathbb{R}^N$  be a **minimum** of  $J$  on the set  $\{u \in \mathbb{R}^N \mid \Theta(u) = 0\}$

Then, there exists a vector  $\lambda^*$  of  $\mathbb{R}^M$  (**Lagrange multiplier**) such that

- $u \mapsto L(u, \lambda^*)$  achieves a minimum at  $u^*$  over  $\mathbb{R}^N$
- $\lambda \mapsto L(u^*, \lambda)$  achieves a maximum at  $\lambda^*$  over  $\mathbb{R}^M$

that is,  $(u^*, \lambda^*)$  is a **saddle point** of the Lagrangian  $L$

These two conditions are equivalent to

$$\begin{aligned}\nabla_u L(u^*, \lambda^*) &= 0 = \nabla J(u^*) + [\Theta'(u^*)]^\top \lambda^* \\ \nabla_\lambda L(u^*, \lambda^*) &= 0 = \Theta(u^*)\end{aligned}$$

# Existence of a minimum and of a saddle point

$$\inf_{u \in \mathbb{R}^N} J(u) \quad \text{subject to} \quad \Theta(u) = 0 \in \mathbb{R}^M$$

## Proposition

We suppose that

- ▶ the criterion  $J$  is **differentiable** and  **$a$ -strongly convex**
- ▶ the function  $\Theta$  is **affine**

Then

- ▶ there exists a **unique minimum**  $u^* \in \mathbb{R}^N$  of  $J$  on the set  $\{u \in \mathbb{R}^N \mid \Theta(u) = 0\}$
- ▶ and there exists a vector  $\lambda^*$  of  $\mathbb{R}^M$  (**Lagrange multiplier**)

such that  $(u^*, \lambda^*)$  is a **saddle point** of the Lagrangian  $L$

- Augmented Lagrangian

# Uzawa algorithm (dual gradient ascent algorithm)

We suppose that

- ▶ the criterion  $J$  is **differentiable** and  **$a$ -strongly convex**
- ▶ the function  $\Theta$  is **affine**, with norm  $\kappa$

Then, when  $0 < \rho < 2a/\kappa^2$ , the following algorithm converges towards the **unique minimum**  $u^*$  of

$$\inf_{u \in \mathbb{R}^N} J(u) \quad \text{subject to} \quad \Theta(u) = 0$$

**Data:** Initial multiplier  $\lambda^{(0)}$ , step  $\rho$ , tolerance  $\epsilon > 0$

**Result:** minimum and multiplier;

**repeat**

$$u^{(k)} = \arg \min_{u \in \mathbb{R}^N} L(u, \lambda^{(k)}) \quad (\text{primal minimization w.r.t. } u)$$

$$\lambda^{(k+1)} = \lambda^{(k)} + \rho \Theta(u^{(k)}) \quad (\text{dual gradient step w.r.t. } \lambda)$$

**until**  $\|\Theta(u^{(k)})\| < \epsilon$ ;

**Algorithm 2:** Uzawa algorithm

# Uzawa algorithm and basic decomposition mechanism

Consider the **optimization problem**

$$\inf_{(u,v) \in \mathbb{R}^N \times \mathbb{R}^P} J(u) + G(v) \quad \text{subject to} \quad \Theta(u) + \Psi(v) = 0$$

whose **Lagrangian** is  $L(u, v, \lambda) = J(u) + G(v) + (\Theta(u) + \Psi(v))^\top \lambda$

The **primal minimization** w.r.t.  $(u, v)$  in Uzawa algorithm is

$$\begin{aligned} L(u^{(k)}, v^{(k)}, \lambda^{(k)}) &= \min_{(u,v) \in \mathbb{R}^N \times \mathbb{R}^P} J(u) + G(v) + (\Theta(u) + \Psi(v))^\top \lambda^{(k)} \\ &= \underbrace{\min_{u \in \mathbb{R}^N} J(u) + \Theta(u)^\top \lambda^{(k)}}_{\text{subproblem in } u} + \underbrace{\min_{v \in \mathbb{R}^P} G(v) + \Psi(v)^\top \lambda^{(k)}}_{\text{subproblem in } v} \end{aligned}$$

by the **interchange formula**

The **primal minimization problem** splits into **2 independent subproblems!**

- Augmented Lagrangian**

# Augmented Lagrangian in case of equality constraints

## Definition

Let  $r > 0$ . The **augmented Lagrangian**  $L_r : \mathbb{R}^N \times \mathbb{R}^M \rightarrow \mathbb{R}$  is defined by

$$L_r(u, \lambda) = \max_{q \in \mathbb{R}^M} \left( L(u, q) - \frac{1}{2r} \|\lambda - q\|^2 \right) = J(u) + \Theta(u)^\top \lambda + \frac{r}{2} \|\Theta(u)\|^2$$

The associated **dual function**  $\psi_r : \mathbb{R}^M \rightarrow \mathbb{R} \cup \{-\infty\}$

$$\psi_r(\lambda) = \inf_{u \in \mathbb{R}^N} L_r(u, \lambda)$$

is the **Moreau-Yosida regularization** of the dual function  $\psi$  in (1)

$$\psi(\lambda) = \inf_{u \in \mathbb{R}^N} L(u, \lambda)$$

and the **Lagrangian**  $L$  and the **augmented Lagrangian**  $L_r$  have the **same set of saddle points**, with better mathematical properties for the augmented Lagrangian (stability, differentiability...)
