Yield Fluids: Motivation

Growing interest due to a wide range of applications:

- Flow of viscoplastic(yield) fluids : civil engineering, materials processing, petroleum drilling operations, food and cosmetics industry.
- Bubbles in viscoplastic flows: Aerated building materials, mousse.

Figure: Examples of applications

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Yield Fluids: Challenges

- Viscoplastic materials are non-Newtonian fluids that require a finite yield stress to flow (solid or fluid-like behavior)
- Yield stress fluids are governed by a non-regular and non-linear constitutive equation
- Solid/liquid boundary not known a priori
- Viscoplastic materials constitute a challenging problem theoretically and experimentally
- Scarce analysis, experimental and numerical data in the literature
- Classical FEM simulations methods are costly for iterative solvers: Not naturally fitted for parallelization.
- Discontinuous skeletal methods are a promising tool to replace FEM.

Yield Fluids: Model problem I

- Let Ω ⊂ R^d, d ≥ 1, denote a d-dimensional open bounded and connected domain
- For a source term $\mathbf{f} \in L^2(\Omega)^d$
- Momentum and mass conservation for incompressible flows:

$$\begin{aligned} \operatorname{div} \boldsymbol{\sigma}_{\mathbf{t}} + \mathbf{f} &= \mathbf{0} & \text{in } \Omega, \\ \operatorname{div} \mathbf{u} &= 0 & \text{in } \Omega, \\ \mathbf{u} &= \mathbf{0} & \text{on } \partial\Omega. \end{aligned}$$

with σ_t total stress tensor and **u** the unknown velocity field.

• Spheric and deviatoric parts:

$$\boldsymbol{\sigma}_t = \boldsymbol{\sigma}_D - \frac{1}{3} tr(\boldsymbol{\sigma}_t) \mathbf{I}$$
(1)

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

Yield Fluids: Model problem II

Viscoplastic fluid model: Bingham model

$$\begin{cases} \boldsymbol{\sigma}_{D} = 2\mu \nabla_{s} \mathbf{u} + \sqrt{2}\tau_{0} \frac{\nabla_{s} \mathbf{u}}{|\nabla_{s} \mathbf{u}|} & \text{when } \sqrt{\frac{1}{2}} |\boldsymbol{\sigma}_{D}| > \tau_{0} \\ \nabla_{s} \mathbf{u} = 0 & \text{otherwise} \end{cases}$$

- with $\tau_0 \ge 0$ and $\mu > 0$ denoting the viscosity and the yield stress respectively.
- ∇_s**u** the symmetric gradient.
- We use the Frobenius norm $|\tau| = \sqrt{\tau : \tau}$

ヘロト ヘアト ヘヨト ヘヨト

▲□▶▲□▶▲□▶▲□▶ □ のQで

Yield Fluids: Model problem II

• Glowinski [2] showed the PDEs can be recast as a minimization problem:

$$\mathbf{u} = \arg \min_{\mathbf{v} \in K(\mathbf{0})} \int_{\Omega} \mathcal{D}(\mathbf{v}) d\Omega - \int_{\Omega} \mathbf{f} \cdot \mathbf{v}$$

where $K(\mathbf{u}_D)$ is the kernel of the divergence operator and defined as $K(\mathbf{u}_D) = \{\mathbf{v} \in L_2(\Omega)^d | \text{div } \mathbf{v} = 0 \in \Omega, \mathbf{u} = \mathbf{u}_D \in \partial\Omega\},\$

• The dissipation energy

$$\mathcal{D}(\mathbf{u}) = \mu |\nabla_s \mathbf{u}|^2 + \sqrt{2}\tau_0 |\nabla_s \mathbf{u}|,$$

Yield Fluids: Augmented Lagrangian Algorithm

• Solve the saddle problem

$$(\mathbf{u}, \gamma, \sigma) = \min_{\mathbf{v} \in \mathbf{H}_0^1, \delta \in \mathfrak{L}_2} \max_{\tau \in \mathfrak{L}_2} \mathcal{L}(\mathbf{v}, \delta, \boldsymbol{\tau})$$

- New constraint $\boldsymbol{\gamma} = \nabla_s \mathbf{u}$
- Augmented Lagrangian:

$$\mathcal{L}(\mathbf{u},\gamma,\boldsymbol{\sigma}) = \frac{\mu}{2} \int_{\Omega} |\gamma|^2 d\Omega + \tau_0 \int_{\Omega} |\gamma| d\Omega - \int_{\Omega} \mathbf{f} \cdot \mathbf{u} d\Omega + \int_{\Omega} \boldsymbol{\sigma} : (\nabla_s \mathbf{u} - \gamma) d\Omega + \frac{\alpha}{2} \int_{\Omega} |\nabla_s \mathbf{u} - \gamma|^2 d\Omega$$

with $\alpha > 0$ is the augmentation parameter.

ALG: Uzawa-like algorithm, n^{th} -iteration

• Weak formulation: Assume σ^n and γ^n , then find $\mathbf{u}^n \in V, \forall \mathbf{v} \in \mathbf{H}_0^1(\Omega)^d$ such that

$$2\alpha(\nabla_{s}\mathbf{u}^{n+1},\nabla_{s}\mathbf{v}) = (\mathbf{f},\mathbf{v}) - (\boldsymbol{\sigma}^{n} - 2\alpha\boldsymbol{\gamma}^{n},\nabla_{s}\mathbf{v}),$$

Solve point-wise

$$\gamma^{n+1}(\mathbf{x}) = \max\left(0, \frac{1}{(2\alpha + \mu)} \frac{\mathbf{X}^{n+1}(\mathbf{x})}{|\mathbf{X}^{n+1}(\mathbf{x})|} \left(|\mathbf{X}^{n+1}(\mathbf{x})| - \tau_0\right)\right)$$

where $\mathbf{X}^{n+1} = \boldsymbol{\sigma}^n + \alpha \nabla_s \mathbf{u}^{n+1}$.

Update the stress

$$\boldsymbol{\sigma}^{n+1} = \boldsymbol{\sigma}^n + \alpha (\nabla_s \mathbf{u}^{n+1} - \boldsymbol{\gamma}^{n+1}).$$

Discontinuous Skeletal methods

- There are differente kinds of DiSk methods: MFD, HFV, HDG, **HHO**. **Di**scontinuous **Sk**eletal methods approximate solutions of BVPs by
 - using discontinuous polynomials in the mesh skeleton
 - attaching unknowns to mesh faces
- Salient features:
 - Dimension-independent construction
 - Supportgeneral meshes(conforming and non-conforming)
 - Arbitrary polynomial order

▲□▶▲□▶▲□▶▲□▶ □ のQで

DISK methods

In this work we use the Hybrid High Order method, introduced recently by Di Pietro et Ern [1, 3] for linear elasticity. Attractive features:

- Designed from primal formulation
- Arbitrary order of polynomials.
- Suitable for hp-adaptivity.
- They can be applied to a fair range of PDE's.
- Gradient reconstruction based on local Neumann problems.

Degrees of freedom I

- We consider as model problem the laplace equation: $-\Delta u = f \in \Omega$
- Cell-Face based method: Hybrid method.
- DoFs are polynomials of order *k* ≥ 0 attached to the mesh cells and their faces.

Figure: DOFs for k = 0, 1, 2.

• We define for all $T \in \mathcal{T}_h$ the local space

$$\underline{\mathbf{U}}_{h}^{k} = \mathbb{P}_{d}^{k}(T) \times \left\{ \underset{F \in \mathcal{F}_{h}}{\times} \mathbb{P}_{d-1}^{k}(F) \right\} \quad \text{ for all } f \in \mathbb{P} \text{ fo$$

Gradient reconstruction I

- The local potential reconstruction operator: $r_T^{k+1} : \underline{U}_T^k \to \mathbb{P}_d^{k+1}(T)$
- The local gradient reconstruction operator: $\nabla r_T^{k+1} : \underline{U}_T^k \to \nabla \mathbb{P}_d^{k+1}(T)$
- Let $\underline{\mathbf{v}} \in \underline{U}_T^k$, then $\nabla r_T^{k+1} \underline{\mathbf{v}} = \nabla s$ with $s \in \mathbb{P}_d^{k+1}(T)$
- ∇s solves the local problem for all $w \in \mathbb{P}_d^{k+1}(T)$

$$(\nabla s, \nabla w)_T = (\nabla \mathbf{v}_T, \nabla w)_T + \sum_{F \in \mathcal{F}_T} (\mathbf{v}_F - \mathbf{v}_T, \nabla w \cdot \mathbf{n}_{TF})_F$$

- Reconstruction operator derives from integration by parts formula.
- Set $\int_T r_T^{k+1} \underline{\mathbf{v}} = \int_T \mathbf{v}_T$ then the reconstructed function is in $\mathbb{P}_d^k(T)$ and is unique.

Gradient reconstruction II

• Local interpolation operator $I_T^k : H^1(T) \to \underline{U}_T^k$, that maps a given function $v \in H^1(T)$ into the broken space of local collection of velocities.

$$I_T^k v = (\pi_T^k v, (\pi_F^k v)_{F \in \mathcal{F}_T}),$$

Conmuting diagram property

$$\begin{array}{ccc} H^{1}(T) & & & \nabla \\ & \downarrow I_{T}^{k} & & \downarrow \pi_{\nabla \mathbb{P}_{d}^{k+1}(T)} \\ & & \cup_{T}^{k} & & & & \nabla \mathbb{P}_{d}^{k+1}(T) \end{array}$$

For all $u \in H^1(T)$ and all $w \in \mathbb{P}_d^{k+1}(T)$

$$(\nabla r_T^{k+1} I_T^k v, \nabla w)_T = (\nabla u, \nabla w)_T$$
(2)

• Thus, $r_T^{k+1}I_T^k$ is the elliptic operator on $\mathbb{P}_d^{k+1}(T)$

- コン・4回ン・4回ン・4回ン・4回ン・4日ン

Reconstruction operator III

Reconstruction operator $r_T^{k+1} \underline{v}$ is used to build the following bilinear form on $U_T^k \times U_T^k$:

$$a_T^{(1)}(\underline{\mathbf{v}},\underline{\mathbf{w}}) = (\nabla r_T^{k+1}\underline{\mathbf{v}}, \nabla r_T^{k+1}\underline{\mathbf{w}})_T$$

Note how $(\nabla r_T^{k+1}\underline{\mathbf{v}}, \nabla r_T^{k+1}\underline{\mathbf{w}})_T$ mimics *locally* the l.h.s. of our original problem

Find $u \in H_0^1(\Omega)$ s.t. $(\nabla u, \nabla v)_{\Omega} = (f, v)_{\Omega}, \quad \forall v \in H_0^1(\Omega)$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Stabilization operator I

- For $\underline{\mathbf{v}} \in U_T^k$, the reconstructed gradient $\nabla r_T^{k+1} \underline{\mathbf{v}}$ is not stable: $\nabla r_T^{k+1} \underline{\mathbf{v}} = 0$ does not imply that v_T and $v_{\partial T}$ are constant functions taking the same value.
- We introduce a least-squares penalization of the difference between functions in the faces and function in the cell

$$S_T^k \underline{\mathbf{v}} := \pi_{\partial T}^k \left(v_{\partial T} - (v_T + r_T^{k+1} \underline{\mathbf{v}} - \pi_T^k r_T^{k+1} \underline{\mathbf{v}}) |_{\partial T} \right),$$

Stabilization operator II

Using the stabilization operator just defined, we build a second bilinear form on $U_T^k \times U_T^k$:

$$s_T(\underline{\mathbf{v}},\underline{\mathbf{w}}) = \sum_{F \in \mathcal{F}_{\partial T}} h_F^{-1}(S_T^k \underline{\mathbf{v}}, S_T^k \underline{\mathbf{w}})_F,$$

where h_F denotes the diameter of the face F.

- The stabilization as defined allows HHO to converge as k + 2 in L_2 norm
- The simpler stabilization considering the difference v_{∂T} − v_T would limit convergence to k + 1

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Global spaces

Local discrete spaces U_T^k , for all $T \in \mathcal{T}$, are collected into a global discrete space

$$\underline{\mathbf{U}}_{h}^{k} := U_{\mathcal{T}}^{k} \times U_{\mathcal{F}}^{k},$$

where

$$U^{k}_{\mathcal{T}} := \mathbb{P}^{k}_{d}(\mathcal{T}) := \{ v_{\mathcal{T}} = (v_{T})_{T \in \mathcal{T}} \mid v_{T} \in \mathbb{P}^{k}_{d}(T), \ \forall T \in \mathcal{T} \}, \\ U^{k}_{\mathcal{F}} := \mathbb{P}^{k}_{d-1}(\mathcal{F}) := \{ v_{\mathcal{F}} = (v_{F})_{F \in \mathcal{F}} \mid v_{F} \in \mathbb{P}^{k}_{d-1}(F), \ \forall F \in \mathcal{F} \}.$$

For a pair $\underline{v}_h := (v_T, v_F)$ in the global discrete space \underline{u}_h^k , we denote \underline{v} , for all $T \in \mathcal{T}$, its restriction to the local discrete space U_T^k , where $v_{\partial T} = (v_F)_{F \in \mathcal{F}_{\partial T}}$ Homogeneous Dirichlet BCs are enforced strongly by considering the subspace

$$U_{h,0}^k := U_{\mathcal{T}}^k \times U_{\mathcal{F},0}^k,$$

where

$$U_{\mathcal{F},0}^k := \{ v_{\mathcal{F}} \in U_{\mathcal{F}}^k \mid v_F \equiv 0, \ \forall F \in \mathcal{F}^b \}.$$

Conclusions

Discrete problem

For all $T \in \mathcal{T}$, we combine reconstruction and stabilization bilinear forms into a_T on $U_T^k \times U_T^k$ such that

$$a_T := a_T^{(1)} + s_T.$$

We then do a standard cell-wise assembly

$$a_h(\underline{\mathbf{u}}_h, \underline{\mathbf{w}}_h) := \sum_{T \in \mathcal{T}} a_T(\underline{\mathbf{u}}, \underline{\mathbf{w}}),$$
$$\ell_h(\underline{\mathbf{w}}_h) := \sum_{T \in \mathcal{T}} (f, w_T)_T.$$

Finally we search for $\underline{\mathbf{u}}_h := (u_T, u_F) \in U_{h,0}^k$ such that

 $a_h(\underline{\mathbf{u}}_h, \underline{\mathbf{w}}_h) = \ell_h(\underline{\mathbf{w}}_h), \qquad \forall \underline{\mathbf{w}}_h := (w_T, w_F) \in U_{h,0}^k,$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Degrees of freedom II

- Due to the hybridization the global number of DOF's is bigger than a FEM approach.
- Compact stencil: due to face DOF's involving only neighbors.
- Cell DOF's are eliminated by static condensation, reducing the computational cost on the solver process.
- Cell DOF's are recovered by local computations

Applying DISK to ALG

Local bilinear forms a_T and s_T on $\underline{\mathbf{U}}_T^k \times \underline{\mathbf{U}}_T^k$

• Diffusion term

$$a_T(\underline{\mathbf{v}},\underline{\mathbf{w}}) := (\nabla_s \mathbf{r}_T^{k+1} \underline{\mathbf{v}}, \nabla_s \mathbf{r}_T^{k+1} \underline{\mathbf{w}})_T + s_T(\underline{\mathbf{v}},\underline{\mathbf{w}}),$$

• Stabilization term: coupling cell and face unknowns

$$s_T(\underline{\mathbf{v}},\underline{\mathbf{w}}) := \sum_{F \in \mathcal{F}_T} h_F^{-1}(\pi_F^k(\mathbf{v}_F - \widehat{\mathbf{r}}_T^{k+1}\underline{\mathbf{v}}), \pi_F^k(\mathbf{w}_F - \widehat{\mathbf{r}}_T^{k+1}\underline{\mathbf{w}}))_F$$

Second velocity reconstruction $\hat{\mathbf{r}}_T^{k+1} : \underline{\mathbf{U}}_T^k \to \mathbb{P}_d^{k+1}(T)^d$

$$\widehat{\mathbf{r}}_T^{k+1} = \mathbf{v}_T + (\mathbf{r}_T^{k+1}\underline{\mathbf{v}} - \pi_T^k \mathbf{r}_T^{k+1}\underline{\mathbf{v}})$$

Stress-strain term

$$c_T(\boldsymbol{\tau}, \underline{\mathbf{v}}) = (\boldsymbol{\tau}, \nabla_s \mathbf{v}_T)_T + \sum_{F \in \mathcal{F}_T} (\boldsymbol{\tau} \cdot \mathbf{n}, \mathbf{v}_F - \mathbf{v}_T) \quad \text{on} \quad \mathfrak{L}^2(T) \times \underline{\mathbf{U}}_T^k.$$

• Global versions of the linear forms are obtained by cell-wise assembly.

DiSK-ALG

Discrete weak formulation: Let σⁿ and γⁿ known, find <u>u</u>_h ∈ <u>U</u>^k_{h,0} such that: ∀<u>v</u>ⁿ⁺¹_h ∈ <u>U</u>^k_{h,0}

$$2\alpha a_h(\underline{\mathbf{u}}_h^{n+1},\underline{\mathbf{v}}_h^{n+1}) = \sum_{T\in\mathcal{T}_h} (\mathbf{f},\mathbf{v}_T)_T - c_h(\boldsymbol{\sigma}^n - 2\alpha\boldsymbol{\gamma}^n,\underline{\mathbf{v}}_h)$$

• Compute γ

$$\boldsymbol{\gamma}^{n+1}(\mathbf{x}) = \begin{cases} 0 & \text{for}|\mathbf{X}^{n+1}(\mathbf{x})| \leq \sqrt{2}\tau_0\\ \frac{1}{2(\alpha+\mu)} \left(|\mathbf{X}^{n+1}(\mathbf{x})| - \sqrt{2}\tau_0\right) \frac{\mathbf{X}^{n+1}(\mathbf{x})}{|\mathbf{X}^{n+1}(\mathbf{x})|} & \text{for otherwise} \end{cases}$$

with $\mathbf{X}^{n+1}(\mathbf{x}) = \boldsymbol{\sigma}^n(\mathbf{x}) + 2\alpha \nabla_s \mathbf{r}_T^{k+1} \mathbf{u}^{n+1}(\mathbf{x}).$

Update stress

$$\boldsymbol{\sigma}^{n+1} = \boldsymbol{\sigma}^n + 2\alpha (\nabla_s \mathbf{r}_T^{k+1} \mathbf{u}^{n+1} - \boldsymbol{\gamma}^{n+1}).$$

Numerical results I

Test Setting

The cases are benchmarks consisting of an unidirectional source along the pipe-axis and no-slip conditions enforced on the walls.

- Test case 1: Poiseuille problem in 1D, analytical solution.
- Test case 2: Circular cross section problem, analytical solution.
- Test case 3: Square cross section problem, no analytical solution.
- The dimensionless Bingham number (Bi) is the ratio between the yield stress and the viscous stress.

Numerical Results I

- Fig. 8 showcases the agreement for tests 1 and 2 between the numerical and analytical solution.
- Computations are done using conforming meshes.

Figure: Velocity profiles for the 1D test case (left) and the circular pipe test case(right).

Numerical Results II

Mesh adapatation:

Features

- Non-conforming meshes.
- Control of the number of hanging nodes per face.
- Marker based on stress values at Gauss nodes

The challenge

• Capture of the transition boundaries: plug region in the center, a concentric annulus as shear zone and a dead region around the corners.

Levels of refinement

- Let \mathcal{T}_h^0 be the initial mesh and \mathcal{T}_h^i the mesh after i- refinement steps.
- Let $T \in \mathcal{T}_i$ and denote its ancestor $T_0 \in \mathcal{T}_0$, such that $T_0 \subset T$.
- Labeling of levels: The level of T is the number of times T_0 has being partitioned to obtain T through the i-adaptive steps.
- After each marking process, check the difference of level be < 2, between neighbors.

Numerical Results III

Circular pipe:

For fine meshes we obtained the expected behavior of the adaptation process, adapting around the inner red line (solid-liquid boundary).

(a) Bi = 0.1

(b) zoom for Bi = 0.1

(c) Bi = 0.7

Future work

- Develop a Cut-Cell-DISK to simulate bubbles.
- hp-adaptivity: straightforward with DISK.
- Other viscoplastic models: Herschel-Bulkley.
- Use of cone programming optimization with DISK methods.
